

Assignment-3

Flask and mongodb

Task 1: JSON API Route

1. Create a Flask application with an `/api` route. When this route is accessed, it should return a JSON list. The data should be stored in a backend file, read from it, and sent as a response.

The screenshot shows a code editor with a file explorer on the left and a code editor on the right. The file explorer shows a project named 'flask_mongodb_dvp' with subfolders 'frontend' and 'venv', and files 'index.html' and 'app.py'. The code editor shows the content of 'app.py'.

```
1 from flask import Flask, request
2
3 app = Flask(__name__)
4
5 @app.route('/')
6 def home():
7     return 'Welcome to the Flask App guys!'
8
9 @app.route('/api')
10 def api():
11
12     name = request.values.get('name', 'Guest')
13     return {
14         'message': f'Hello, DVP! This is new data form.'
15     }
16
17 if __name__ == '__main__':
18
19     app.run(debug=True)
20
```

Output

The screenshot shows a terminal window with the following output:

```
dvprasad@ubuntu24:~/Desktop/flask_mongodb_dvp$ source /home/dvprasad/Desktop/flask_mongodb_dvp/venv/bin/activate
(venv) dvprasad@ubuntu24:~/Desktop/flask_mongodb_dvp$ python3 app.py
* Serving Flask app 'app'
* Debug mode: on

```

Welcome to the Flask App guys!

/api:

Task 2: Frontend Form with MongoDB Atlas

2. Create a form on the frontend that, when submitted, inserts data into MongoDB Atlas.

3. **On success:** the user should be redirected to another page displaying the message "Data submitted successfully".

4. **On error:** display the error on the same page without redirection.
